

What happens when a bug occurs?

• Nothing, the program and/or the OS are ‘fault tolerant’

- The program gives a wrong result or crashes but the security of the system is not compromised

- The resources are no longer accessible (locked)
or the OS crashes

- The program computes something that it is not supposed to (malicious code)

Severity

What happen when a bug occurs?

Severity

- Nothing, the program and/or the OS are “fault tolerant”
- The program gives a wrong result or crashes but the security of the system is not compromised
- The resources are no longer accessible (locked) or the OS crashes
- The program computes something that it is not suppose to (malicious code)

How to find a program vulnerability?
