

# Something that you are or do - Biometrics

“An authenticator takes a measure of your physical characteristics and compare it with an existing measure of what you are suppose to be”

- ✓ The robustness depends on the precision of this measure and the similarity criteria (often not strict equality)
- But how to recover from an attack where the physical characteristics are compromised?

Something that you are

- ✓ **Good as long as** you act or look like the same and nobody cannot be “good enough” in doing what you do or “pretend” to look like you
- ⦿ **Gets compromised as soon as** someone can “nearly” act like your “nearly” look like you (depending on the authenticator)
