Asymmetric Protocols

Thierry Sans

Goals

1. Establish a session key to exchange data while ensuring Perfect Forward Secrecy

   ✓ Use the Diffie-Hellman key exchange protocol

2. Ensure one-way or mutual authentication

   ✓ Use asymmetric encryption

The Needham-Schroeder public-key protocol for mutual authentication

Assumptions and Goals

Assumptions

- 4 principals : **A**lice, **B**ob, **M**allory and a Public-Key **S**erver

- Alice, Bob, Mallory and the Server have generated their own public/private key pair

- Alice, Bob and Mallory know the Server's public key Kps

- A, B, M and S talk to each other using the same protocol
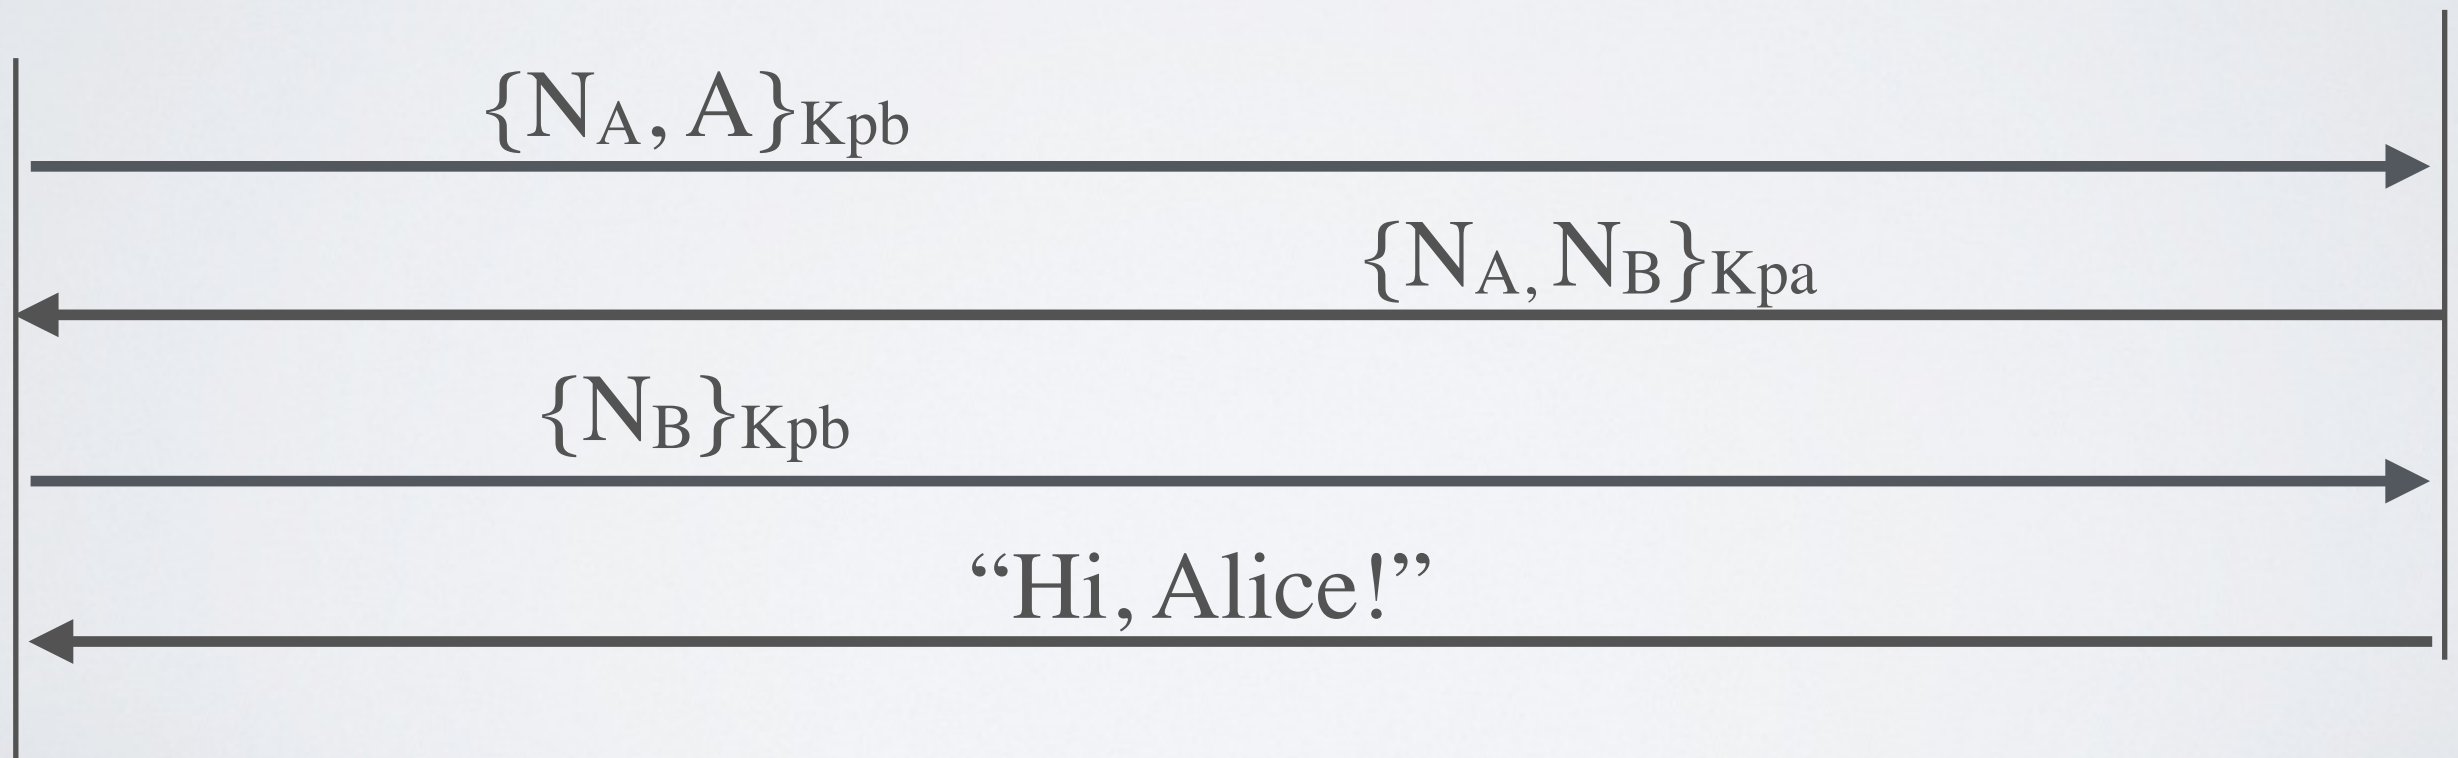

Goals

When two parties want to engage in the communication, they want to make sure that they talk to the right person (authentication)
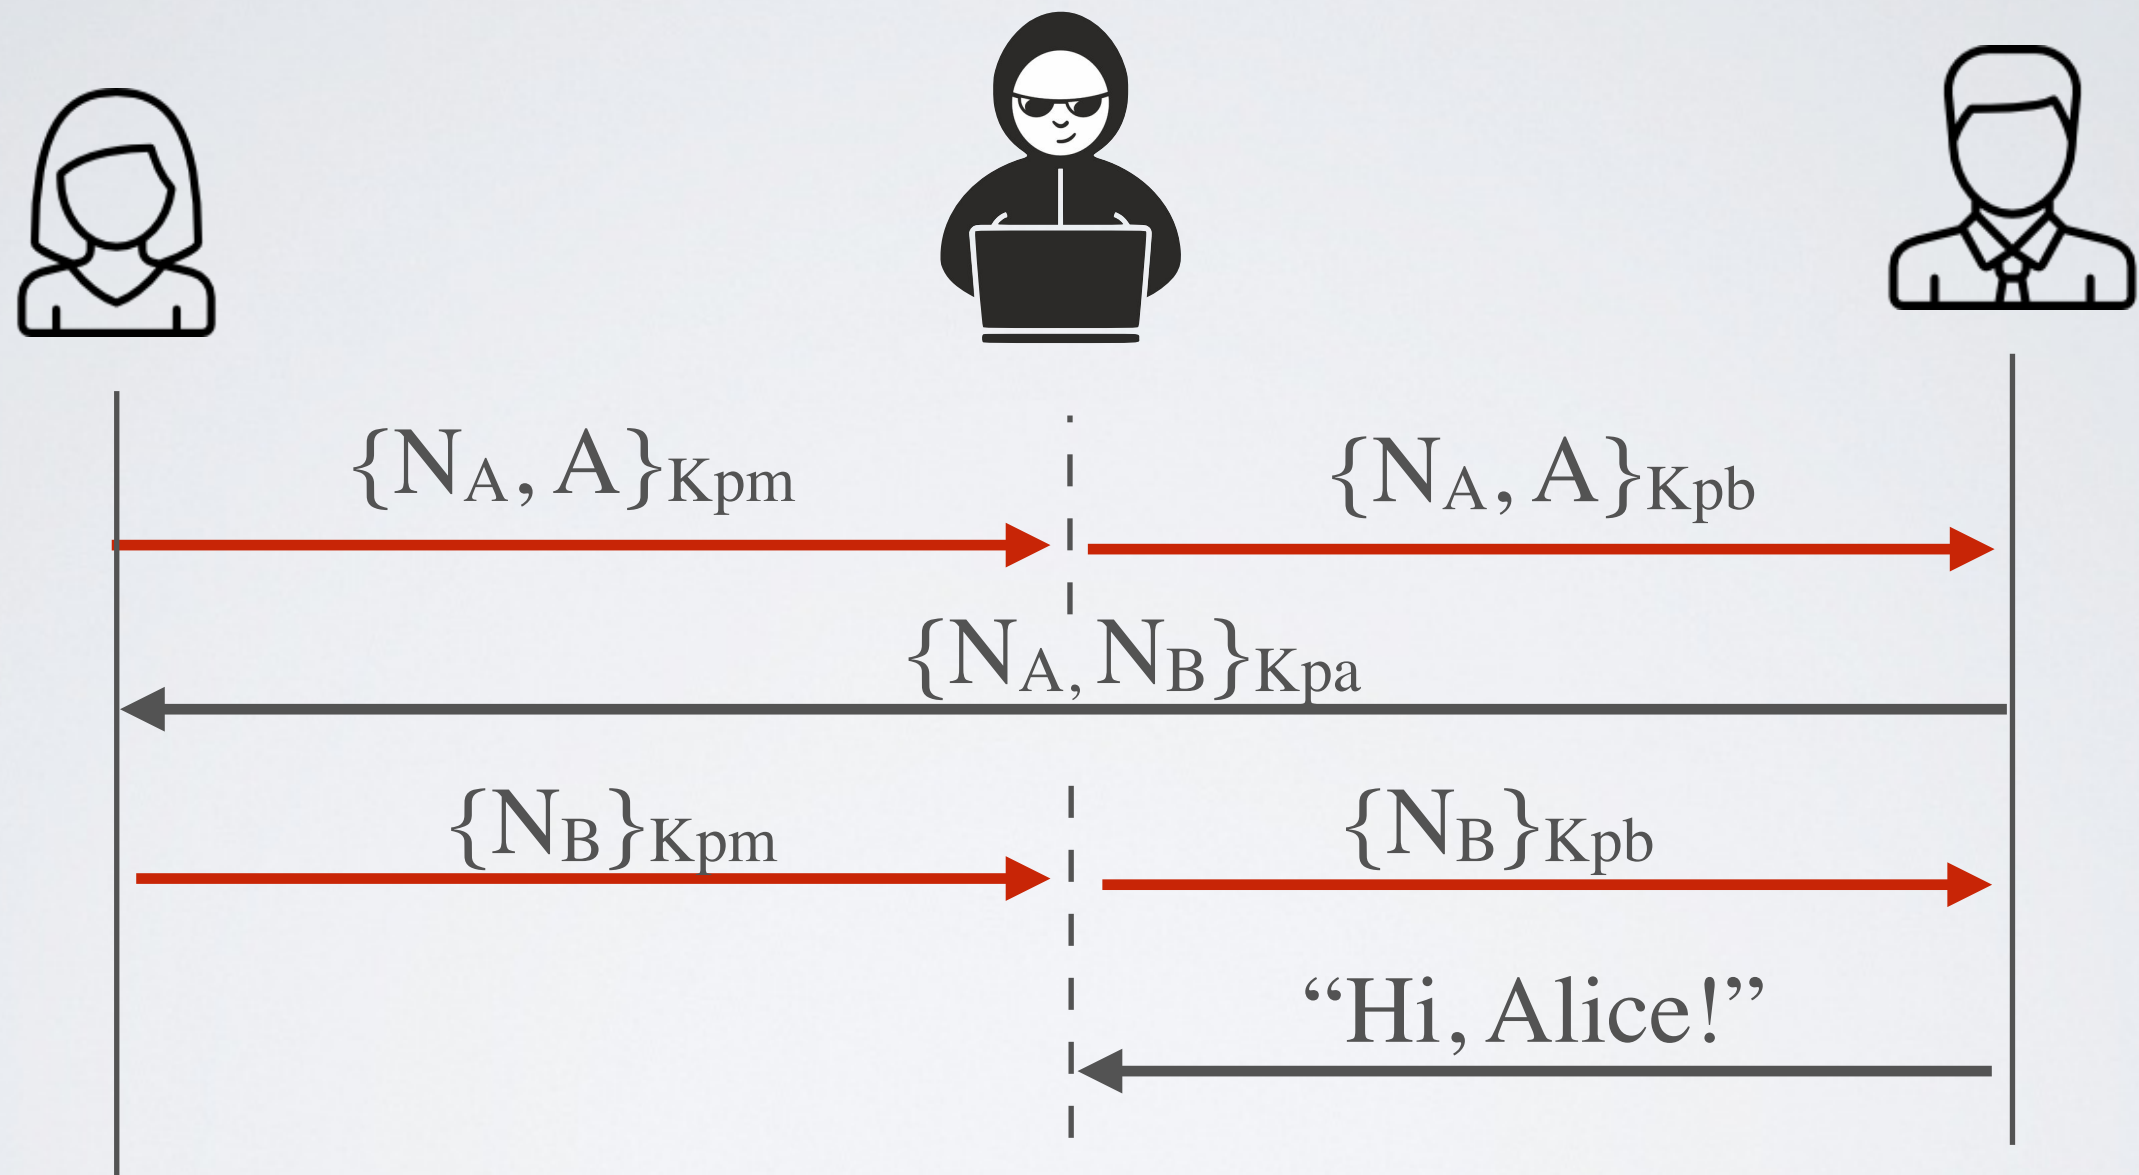

The vulnerable version (1978)

A, B

$\{K_{pb}, B\}_{Kss}$

$\{N_A, A\}_{Kpb}$

B, A

$\{K_{pa}, A\}_{Kss}$

$\{N_A, N_B\}_{Kpa}$

$\{N_B\}_{Kpb}$

"Hi, Alice!"
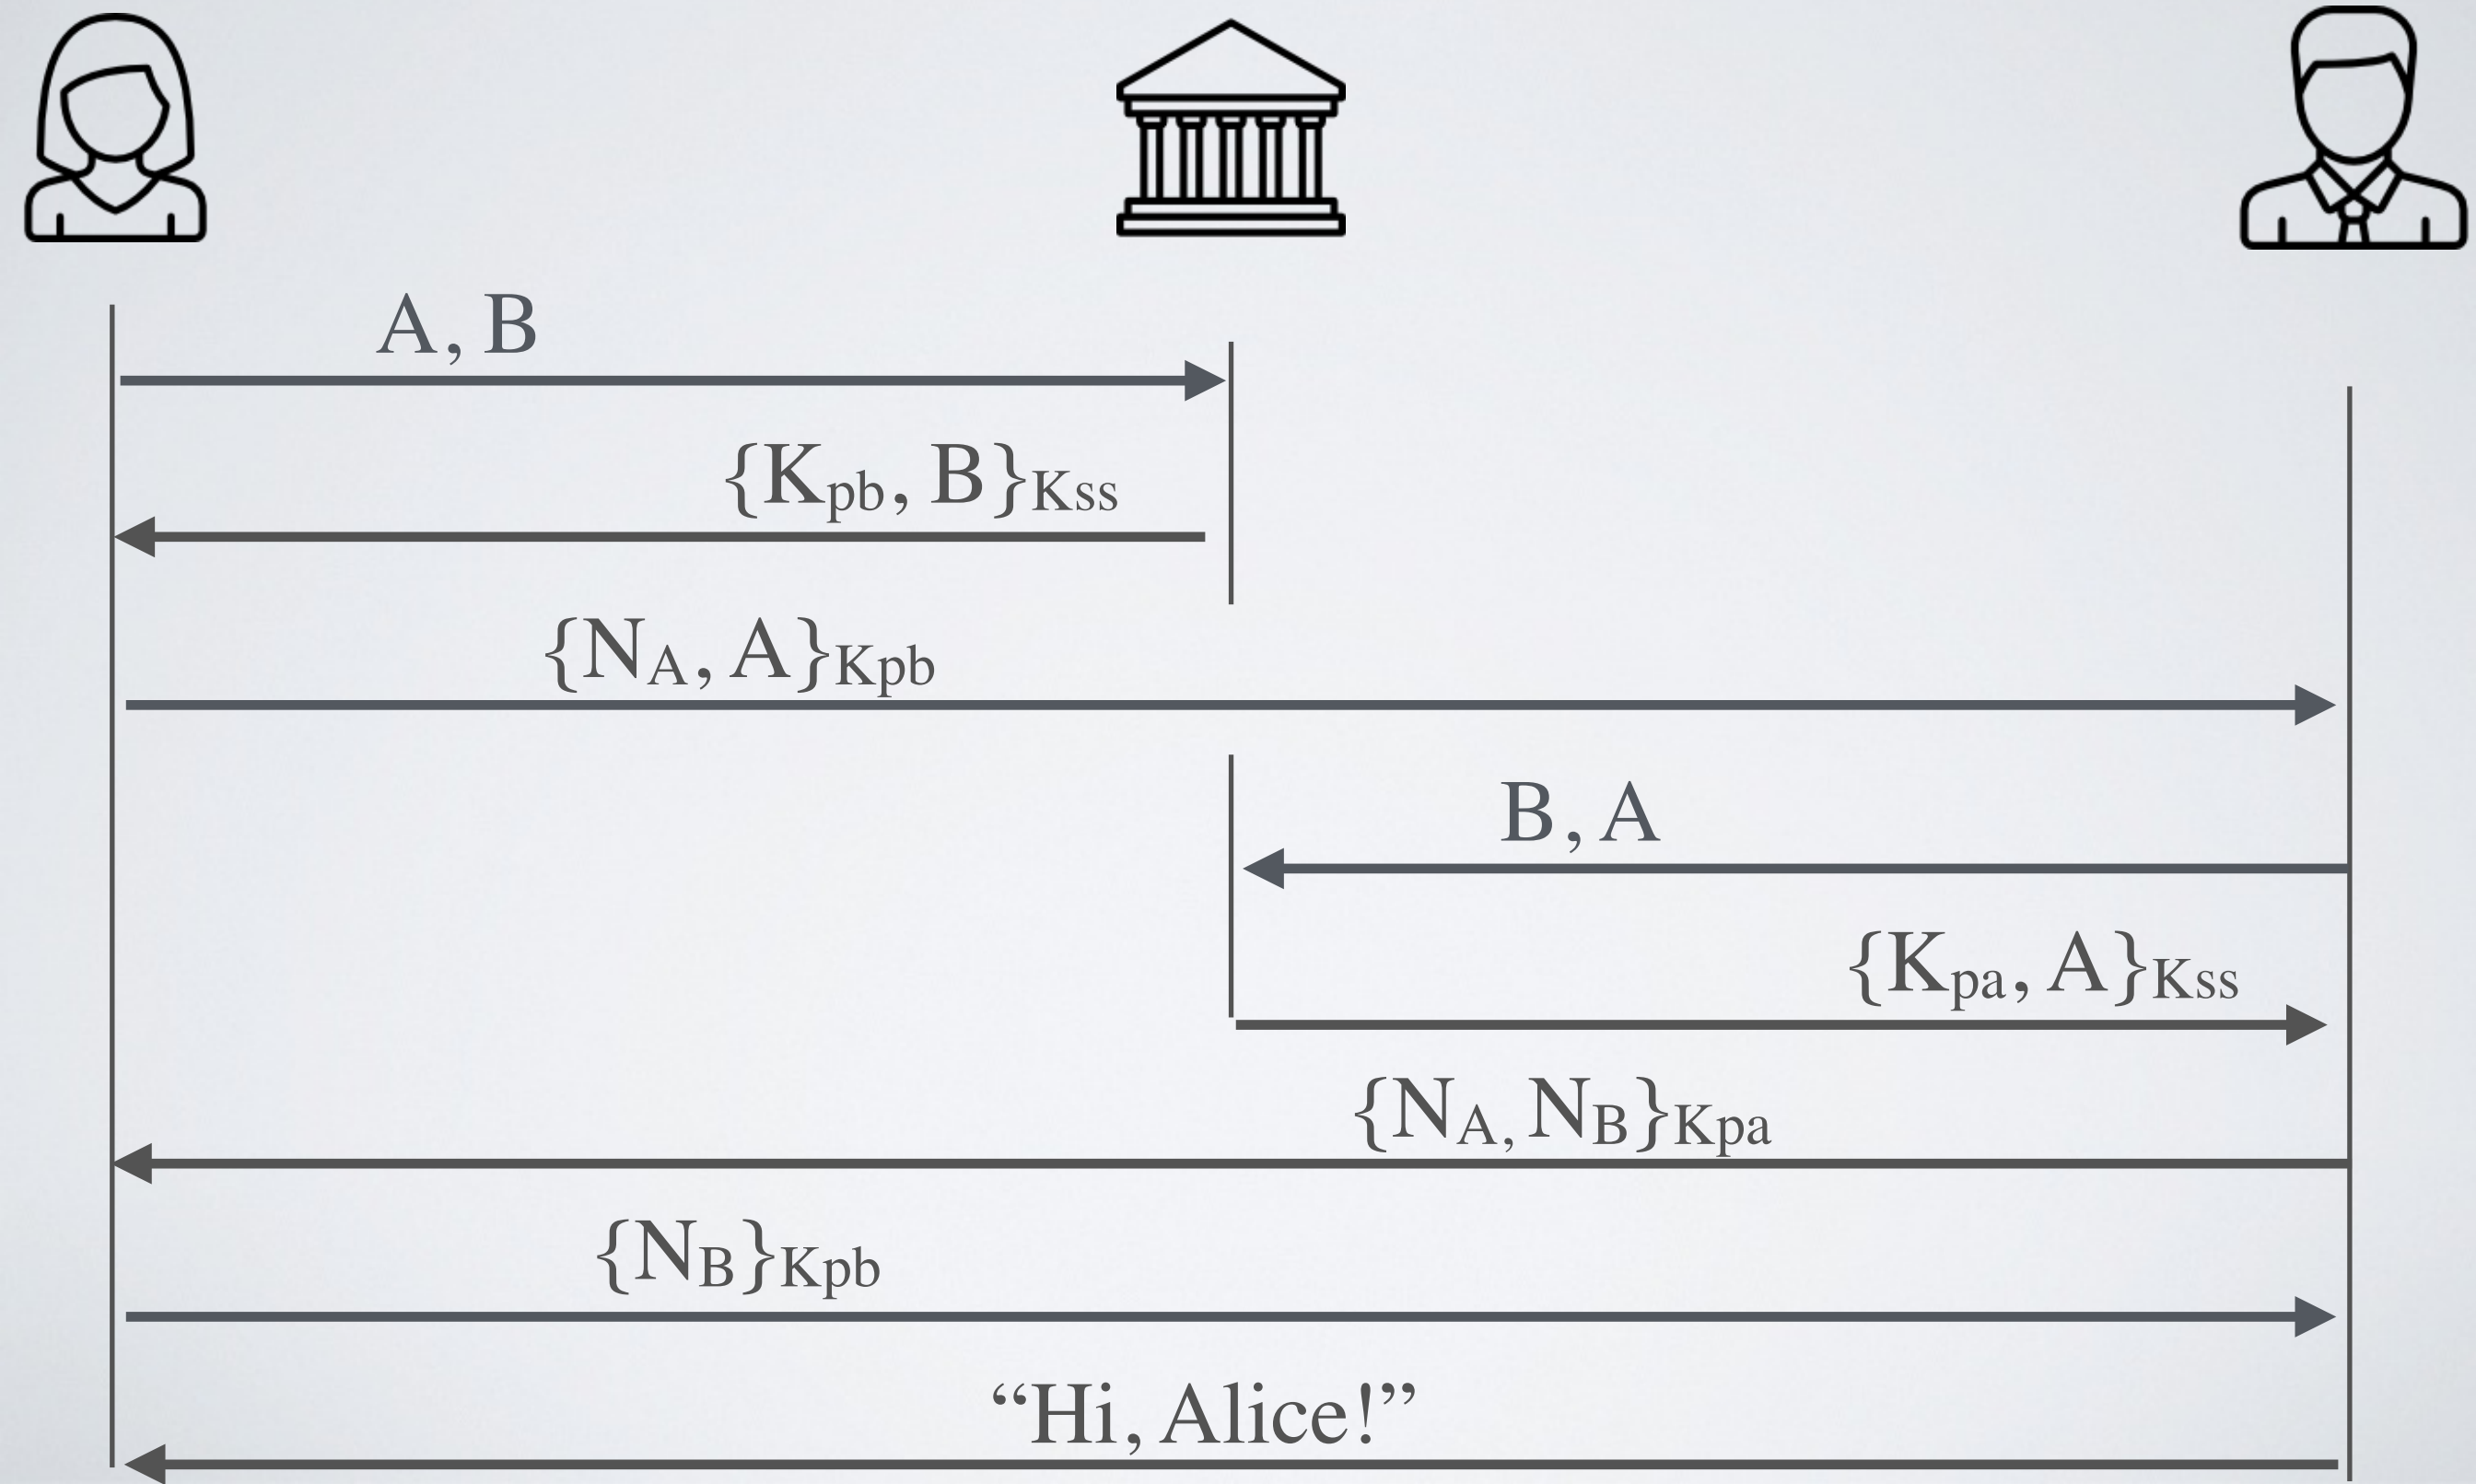

Simplified (but still vulnerable) version (1978)

$\{N_A, A\}_{Kpb}$

$\{N_A, N_B\}_{Kpa}$

$\{N_B\}_{Kpb}$

"Hi, Alice!"

Man-in-the-middle attack (Lowe's 1995)

$\{N_A, A\}_{Kpm}$ $\{N_A, A\}_{Kpb}$

$\{N_A, N_B\}_{Kpa}$

$\{N_B\}_{Kpm}$ $\{N_B\}_{Kpb}$

"Hi, Alice!"

Lowe's fix (1995)

$$\{N_A, A\}_{Kpb}$$

$$\{N_A, N_B, B\}_{Kpa}$$

$$\{N_B\}_{Kpb}$$

"Hi, Alice!"

Not a perfect protocol yet

✓ Does authenticate Alice and bob

✓ Does prevent replay attacks

✓ Does ensure the authenticity of the public keys

◉ But the Public Key Server is a <u>single point of failure</u>

# TLS - Transport Layer Security a.k.a SSL - Secure Sockets Layer

This how HTTPS works

Who are you?

I am example.com

HTTPS request

HTTPS response

example.com
✓ **HTTPS = HTTP + TLS**

➡ TLS - Transport Layer Security (a.k.a SSL) provides

- **confidentiality :** end-to-end secure channel
- **integrity :** one-way authentication handshake

simplified and one-way authentication TLS 1.2 (2008)

N_A

$N_B, DH_B, Cert_B, sign(H(_{N_A \parallel N_B \parallel DH_B}))$

DH_A

Fin

simplified and one-way authentication TLS 1.3 (2018)

$N_A, ECDH_A$

$N_B, ECDH_B, [Cert_B, sign(H(N_A \| N_B \| ECDH_A \| ECDH_B \| Cert_B)))]_K$

TLS 1.3 is much better than TLS 1.2

✓ Only one round in the handshake (vs 2 with TLS 1.2)

✓ Faster (use of elliptic curves)

✓ Certificate is encrypted (better confidentiality)

✓ Protocol has been formally proven
(dos not prevent from implementation bugs)

Almost there …

✓ Does ensure the confidentiality of the communication

✓ Does authenticate Alice and bob

✓ Does prevent replay attacks

➡ But how to ensure the authenticity of the public keys without using a Public Key Server ?

Trust Models

Two trust models

How to establish the authenticity of the binding between someone and its public key ?

Decentralized trust model

➡ **Web of Trust**

Centralized trust model

➡ **PKI - Public Key Infrastructure**

Do you trust the GPG key ?

I am Bob!

Alice

Bob

P_{km}
Alice should verify Bob's public key fingerprint

- either by communicating with Bob over another channel

- or by trusting someone that already trusts Bob

➡ **the web of trust**

The web of trust

Generating and using (self-signed) certificates
Self-signed certificates are not trusted by your browser

This Connection is Untrusted

You have asked Firefox to connect securely to **www.domainname.tld** but we can't confirm that your connection is secure.

Normally, when you try to connect securely, sites will present trusted identification to prove that you are going to the right place. However, this site's identity can't be verified.

What Should I Do?

If you usually connect to this site without problems, this error could mean that someone is trying to impersonate the site, and you shouldn't continue.

Get me out of here!

▶ **Technical Details**

▼ **I Understand the Risks**

If you understand what's going on, you can tell Firefox to start trusting this site's identification. **Even if you trust the site, this error could mean that someone is tampering with your connection.**

Don't add an exception unless you know there's a good reason why this site doesn't use trusted identification.
Add Exception...

Your connection is not private

Attackers might be trying to steal your information from **bitbucket.org** (for example, passwords, messages, or credit cards).

Hide advanced   Reload

bitbucket.org normally uses encryption to protect your information. When Chrome tried to connect to bitbucket.org this time, the website sent back unusual and incorrect credentials. Either an attacker is trying to pretend to be bitbucket.org, or a Wi-Fi sign-in screen has interrupted the connection. Your information is still secure because Chrome stopped the connection before any data was exchanged.

You cannot visit bitbucket.org right now because the website uses HSTS. Network errors and attacks are usually temporary, so this page will probably work later.

NET::ERR_CERT_DATE_INVALID

The Chain of Trust

Your browser trusts many root CAs **by default**

Real attacks

An update on attempted man-in-the-middle attacks

August 29, 2011

Posted by Heather Adkins, Information Security Manager

Today we received reports of attempted SSL man-in-the-middle (MITM) attacks against Google users, whereby someone tried to get between them and encrypted Google services. The people affected were primarily located in Iran. The attacker used a fraudulent SSL certificate issued by DigiNotar, a root certificate authority that should not issue certificates for Google (and has since revoked it).

Google Chrome users were protected from this attack because Chrome was able to detect the fraudulent certificate.

Enhancing digital certificate security

January 3, 2013

Posted by Adam Langley, Software Engineer

Late on December 24, Chrome detected and blocked an unauthorized digital certificate for the "*.google.com" domain. We investigated immediately and found the certificate was issued by an intermediate certificate authority (CA) linking back to TURKTRUST, a Turkish certificate authority. Intermediate CA certificates carry the full authority of the CA, so anyone who has one can use it to create a certificate for any website they wish to impersonate.

Limitation of secure channels
